Individual and Organizational Image and Reputation by Cyber Technologies

Chutisant Kerdvibulvech, Ph.D.
Assistant Professor

ผศ.ดร.ชุติสันต์ เกิดวิบูลย์เวช

CM 7103 Corporate Image and Reputation Management (การจัดการภาพลักษณ์และชื่อเสียงองค์กร)

Overview

- Background
- Cyber Technological Trends for Media
- Corporate Image and Reputation Management by Future Technologies

Education

- B.E. (Hons) in Computer Engineering
  Chulalongkorn University

www.chula.ac.th/

- MSc. / Ph.D. in Engineering, Department of Information and Computer Science
  Keio University, the oldest university in Japan

www.keio.ac.jp

Academic Work Experience

- Teaching and being as a research committee in following universities, such as
  - Rangsit University, Sripatum University, PIM
  - Chulalongkorn University, Mahidol University, Kasetsart University
  - NIDA
- Technical Committees for many avademic international conferences and journals (Scopus and Scimago)

Media Work Experience (1/3)

1. Newspapers

- IT Columnist for Dailynews newspaper, every Wednesday (page 23)

Media Work Experience (2/3)

2. Magazines

- Columnist for Manager 360° Magazine, iTech 360°

- Columnist for e-commerce Magazine, Augmented Reality

Media Work Experience (3/3)

3. Televisions

- IT News Analyst for Nation Channel TV Program

- IT News Analyst for RSU TV Channel

Cyber Technologies Trends for Media

Digital Media

Digital media are any media that are encoded in a machine-readable format. [*Technology Brief*. University of Guelph.]

1. Digital Imagery / Digital Video
2. Web Pages / Websites
3. Digital Audio, e.g. mp3s
4. e-books
5. Social Media

www.linkedin.com

Important Role of Digital Media

Online video has become ubiquitous, digital media consumption has become the norm.

Facts about Digital Media

1. Viewers are heavily engaged with digital media – less so with linear television and newspaper.
2. Television and newspaper still matter, but it can no longer succeed as a stand alone platform.

Japan firm showcases Bat-Signal of the future

20 OCT 2014

A free-floating image created by firing lasers into thin air was unveiled in Japan on Monday, offering the possibility one day of projecting messages into a cloudless sky, as seen in Batman.
And, like the Bat-Signal that alerted the Caped Crusader to trouble brewing in Gotham City, its inventors hope that it might eventually be used to warn people of danger such as an approaching tsunami.
The company behind the technology, Burton Inc., showed off rotating spirals, fluttering butterflies and the outline of an apple hovering a few metres over a van loaded with the system.

New Viewpoint Analysis

Prof. Takeo Kanade,
Carnegie Mellon University (CMU),
United States

Super Bowl

- Football fans treated to a unique new view of the action during playbacks
- CBS Television used a new technology
- Carnegie Mellon University computer vision expert, Prof. Takeo Kanade

Super Bowl

- "Eye Vision"
- Involves shooting multiple video images of a dynamic event, such as a football game, from multiple cameras placed at different angles
- The video streams from these cameras are combined by computer and the resulting images reach viewers in a format that will make them feel as if they are flying through the scenes they see.

10

Eye Vision from Prof. Takeo Kanade, CMU

The Matrix

www.imdb.com

- "Virtualized Reality"
- People will be able to customize the perspective from which they watch, for example, from that of a particular object.

11 

New Viewpoint Analysis

Augmented Reality

What is Augmented Reality (AR)?

- A combination of a real scene viewed by a user and a virtual scene generated by a computer that augments the scene with additional information.
- Generates a composite view for the user.

What is the Goal of AR?

- To enhance a person's performance and perception of the world
- But, what is the ultimate goal?

"Augmented reality in urban places: contested content and the duplicity of code." Transactions of the Institute of British Geographers, 2012

The Ultimate Goal of AR

- Create a system such that no user CANNOT tell the difference between the real world and the virtual augmentation of it.

AR in Commerce *Geek.com*

Augmented Reality vs. Virtual Reality

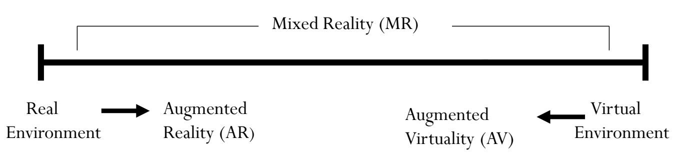
Augmented Reality

- System augments the real world scene
- User maintains a sense of presence in real world
- Needs a mechanism to combine virtual and real worlds

Virtual Reality:

- Totally immersive environment
- Visual senses are under control of system

Miligram's Reality-Virtuality Continuum



csis.pace.edu

Miligram coined the term "Augmented Virtuality" to identify systems which are mostly synthetic with some real world imagery added such as texture mapping video onto virtual objects.

Augmented Reality is closest to the real world because mainly a user is perceiving the real world with just a little computer generated data.

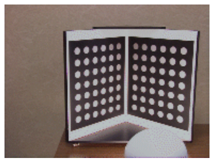
Combining the Real and Virtual Worlds

We need:

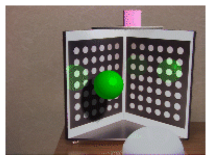
- Precise models
- Locations and optical properties of the viewer (or camera) and the display
- Calibration of all devices
- To combine all local coordinate systems centered on the devices and the objects in the scene in a global coordinate system

Combining the Real and Virtual Worlds (cont)

- Register models of all 3D objects of interest with their counterparts in the scene
- Track the objects over time when the user moves and interacts with the scene



real world



real world with virtual objects and inter-reflections and virtual shading

Mixed Reality

- Human pacman: A mobile wide-area entertainment system based on physical, social, and ubiquitous computing

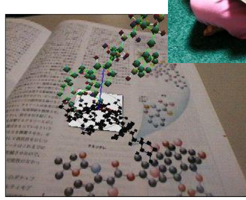
Dr. Adrian Cheok,
National University of Singapore (NUS)
at Singapore

Broadcast in Discovery Channel

This image depicts and artist's conception of a mixed reality enhanced book. The reader is able to read the actual book, but simultaneously see three dimensional computer graphics co-located with, and in registration with the book.



www.sonycsl.co.jp

Realistic Merging

Requires:

- Objects to behave in physically plausible manners when manipulated
- Occlusion
- Collision detection
- Shadows

**All of this requires a very detailed description of the physical scene

Research Activities

- Develop methods to register the two distinct sets of images and keep them registered in real-time
  - New work in this area has started to use Computer Vision (CV) techniques
- Develop new display technologies for merging the two images

Performance Issues

Augmented Reality systems are expected:

- To run in real-time so that the user can move around freely in the environment
- Show a properly rendered augmented image

Therefore, two performance criteria are placed on the system:

- Update rate for generating the augmenting image
- Accuracy of the registration of the real and virtual image

Failures in Registration

Failures in registration due to:

- Noise
  - Position and pose of camera with respect to the real scene
  - Fluctuations of values while the system is running
- Time delays
  - In calculating the camera position
  - In calculating the correct alignment of the graphics camera

Applications

- Medical
- Military Training
- Hazard Detection
- Engineering Design
- Robotics and Telerobotics
- Training
- Sports
- Tourism
- Video conferencing

Applications (cont.)

- Entertainment, Computer Games
- Manufacturing, Maintenance, and Repair
- Consumer Design
- Audio
- Education
- Architecture
- Human welfare

Recent Augmented Reality Applications

Sixth Sense

Sixth Sense

- A wearable gestural interface that augments the physical world around us with digital information
- Let us use natural hand gestures to interact with that information
- The SixthSense prototype is comprised of a pocket projector, a mirror and a camera.

Sixth Sense in 21st Century

Dr. Pattie Maes,
Massachusetts Institute of Technology
(MIT), United States

Broadcast in TED

2

TED
TALKS

Detail of Sixth Sense

- Sixth Sense allows people to use the internet without a screen or a keyboard
- It can turn any surface into a touch screen
- It is made with store-bought components
- "*The software program processes the video stream data captured by the camera and tracks the locations of the colored markers [that you wear on your fingers] using simple computer-vision techniques*"..from MIT Media Lab

Detail of Sixth Sense

- The device recognizes items in stores, and then gathers and projects information about products to the user.
- It also is able to provide quick signals to let users know what the best products are based on their needs."
- Recognize articles in newspapers, retrieve the latest related stories or video from the Internet and then display them on pages for the user
- Say goodbye to your encyclopedia

Cost of Sixth Sense

- Only $350 dollars, around 12,000 baht
- From an educator's stand point, this is minimum given the amount of money spent on textbooks, computer labs and LCD projectors.
- For educator's, Sixth Sense would be a way to put technology (literally) into each student's hands, because of its size and its cost.

UNIVERSITY OF OXFORD
DPhil in Information, Communication and the Social Sciences
The DPhil in Information, Communication and the Social Sciences (doctoral) programme provides an opportunity for highly qualified students to undertake cutting edge Internet-related research. We are looking for academically excellent candidates who display the potential and enthusiasm necessary to perform research that will make a difference -- to ask important questions and to adopt innovative methodologies and approaches for exploring those questions. Many OII doctoral students are pursuing research that will shape the development of digital networked spaces and those whose lives are affected by it.
OII Research Fellow Kathryn Eccles has been appointed 'Digital Humanities Champion' for the University of Oxford. She will help develop the cross-University Digital Humanities strategy.

General Info
Digital media is changing from conventional mass media to personal media that uses media infrastructure for community building. Examples include the convergence of broadcasting and communications and the emergence of social networking services. Content adds value to media, and design enhances all aspects of life. These have become important engines in enriching the human heart and mind. For media, content, and design to take root in society, it is crucial to understand how they function as industries, to understand their business and management models, and to include policies about intellectual property
describe in "Our philosophy of education," we train "media innovators," defined as peop
