AUGMENTED REALITY MAGIC

Augmented Reality Magic

- Now that an ever-accelerating cascade of eye-popping visual technology such as AR has threatened to steal some of the magic dust from old-fashioned magicians
- Along comes a pasteboard prestidigitator who folds augmented reality into the magic world

Augmented Reality Magic (card trick)

- Blend of technology and illusion creates the magic of tomorrow, today

Communication and Technology

The Stanford Department of Communication has been a pioneer in studying the relationship between people and digital media for decades. In the early nineties, Clifford Nass and his graduate students were among the first in the world to empirically examine constructs such as agency and anthropomorphism. Soon thereafter Byron Reeves and Clifford Nass published their landmark book, *The Media Equation*, which set the stage for a new research paradigm based on the notion that the brain has not evolved to differentiate mediated experiences from actual ones. Indeed, one of the fastest growing divisions of the International Communication Association, Communication and Technology, is substantially based on the work of Stanford scholars.

Currently, the area focuses on measures to understand games to address critical the phenomenon of digital media from a historical

The area also draws from collaborations with social MediaX. Moreover, by "social networking" re

DPhil in Information, Communication and the Social Sciences

The DPhil in Information, Communication and the Social Sciences (doctoral) programme provides an opportunity for highly qualified students to undertake cutting edge Internet-related research. We are looking for academically excellent candidates who display the potential and enthusiasm necessary to perform research that will make a difference -- to ask important questions and to adopt innovative methodologies and approaches for exploring those questions. Many OII doctoral students are pursuing research that will shape the development of digital networked spaces and those whose lives are affected by it.

OII Research Fellow Kathryn Eccles has been appointed 'Digital Humanities Champion' for the University of Oxford. She will help develop the cross-University Digital Humanities strategy.

General Info

Digital media is changing from conventional mass media to personal media that uses media infrastructure for community building. Examples include the convergence of broadcasting and communications and the emergence of social networking services. Content adds value to media, and design enhances all aspects of life. These have become important engines in enriching the human heart and mind. For media, content, and design to take root in society, it is crucial to understand how they function as industries, to understand their business and management models, and to include policies about intellectual property as described in "Our philosophy of education," we train "media innovators," defined as people who

INTRODUCTION TO COMPUTER VISION

Vision

- Vision is the process of discovering what is present in the world and where it is by looking.

Computer Vision

- “**Computer vision** is the science and technology of machines that see. As a scientific discipline, computer vision is concerned with the theory behind artificial systems that extract information from images. The image data can take many forms, such as video sequences, views from multiple cameras, or multi-dimensional data from a medical scanner.”

By Dana H. Ballard, Computer Vision.

Computer Vision

- Computer Vision is the study of analysis of pictures and videos in order to achieve results similar to those as by men.

Introduction of Computer Vision

- Digital Image Processing (IP)
 - ▣ Since 1960's
 - ▣ 1970's : Recognized as a technology for practical use.
 - ▣ Most Important Issues : Image Transformation
 - ▣ Noise/Blur Compensation, Distortion Correction

Introduction of Computer Vision

- Computer Vision (CV)
 - ▣ Emerged from AI (Artificial Intelligence) Research
 - ▣ Computational Vision proposed by Marr
 - Shape from X(X:shading, texture, contour, motion...etc.)
 - 3D Scene Understanding from 2D images
 - ▣ Robot Vision: Vision functionality for Robots
 - ▣ Media Processing, Human Interface
